Using PHP to make a template for your Personal Page

This assignment will count as 15% of your grade for your final personal page.

In assignment you will create a common header and footer for your final project. The HTML must be w3 compliant and pass wave validation. These requirements are just a repeat of the requirements of your "Your Responsive Page" assignment. The difference is that you are using a common header and footer file (at a minimum) for each of the content pages.

Steps:
1) Create a footer file. You must have a "Last changed" timestamp for the last time the page you are looking at was updated. **6pts**

2) Create a header file in php. This page should include a nav tag. In the nav, make sure to clearly indicate which of the links is the currently active page. **6pts**

3) Create and host **three pages** that use the common header and footer but still have a unique value for the title tag. Your content may be sparse, but all links must be functional, including links to images. **3pts**

DELIVERABLES
1) Put the link to your main page in the comments section.
2) Zip up all of your code and submit as a file upload.
