Final Portfolios

Each final portfolio must be at least three (3) pages and use PHP. Each page MUST have:

Header
The header must be nicely styled and interesting. Use an image, logo, gradient, *something* other than plain text.

Navigation bar
The navigation bar can be located anywhere you would like (absolute, fixed, top, side, a mixture based on viewport).

Footer
The header must be nicely styled and interesting.

Content
The content is completely up to you. But each content page must include a minimum of two paragraphs or some other original content that takes up a majority of the window. I will grade on spelling, grammar, etc. At least two of the three pages must have text. One page must have a working form that is integrated nicely into your site. (So don't just spit out the form data.)

Other Notes
Responsiveness
You must use a fluid design and have at least three different views.

Accessibility
You should follow the general guidelines discussed in class. If you take particular pains to address accessibility, tell me!!

Validation
Pages do not need to completely validate, as long as the errors are caused by code completely outside of your control.

People who complete these requirements will receive 92%. If you would like a higher grade, do more. Here are some examples from last year of OUTSTANDING pages (339 and 539). They all received 100%.

Submission

You will submit a link to your code. In the comments section please include:

1) Where you used PHP
2) What grade you expect to receive
3) Why you expect to get that grade. (Assume an extra 2% for each "interesting" addition.)

You may not hand in a site that is completely based on my website.
